Warren,

Thank you for this.

If I understand you correctly, the ESI numbers reflect an initial called-in "hand count" of respondents who expressed a presidential preference but who may not have completed all of the other demographic and issue exit poll questions.

Clearly, if it were equally reliable this larger sample would be the preferred presidential exit poll data. However, you state that you suspect that the large discrepancies in the two precincts may be the result of hand-tally error. This seems to suggest that the hand tally data are not very reliable. Is the "hand tally" sample sufficiently larger to justify using it even though it may be incorrect? At this point, it seems that it might be best to use the smaller but more reliable (sub) sample of complete interviews? This does not seem to make a big difference for most of the precincts except for those two. (However, as I've noted, these small -3 to +3 percent exit poll differences could easily affect the ESI analysis - such as it is - of the difference between the Bush 2004 and 2000 vote as the officially reported Ohio vote difference was less than 1%. This will be discussed in our forthcoming paper in detail.) Also, it is fully, and publicly, documented

In any case, may I suggest that you, or ESI, release whatever records you have of the "hand tally" sample to the public. Among other things, this would add public transparency to the investigation of the two precincts, and clarify the confusion over these extremely important data.

Thanks again for your response.

Ron

Ron,
We have said over and over again that the ICPSR data was a subset. This does not raise any questions. This is part of the description of what has been archived and it has been the same for the last 30 years.

Don't urge me to release anything that we have not already released. I intend to live up to protecting respondent confidentiality. If you bring it up again I will not respond to anything else you may write. I'm sick of this nonsense. You people are unethical.

Ron,

I said: "If you bring it up again I will not respond to anything else you may write."
Apparently you did not believe me. Don't bother to write again. I wont answer you.

We have never hidden the fact that the tabulations were a subsample. >From our 1/19/04 evaluation report: "Note that because the questionnaires are subsampled, the age, race, and gender completion rates may be slightly inconsistent with the overall completion rate."

Warren,

The issue is not whether you answer me or not (I assume that you won't) - its are you going to do anything about this?

You have the power and the responsibility to help resolve a burning national crises over the state of our election system. Regardless of the position of members of the NEP, you can take a public stance for release of the data.

In fact, as I recall, AAPOR "ethics guidelines" require full release of the raw data (which in this case should also include anonymous data on pollsters and polling conditions) subject to preserving respondent confidentiality - so you can claim that you are legally bound to fully release the data subject to this restriction.

I urge you, for the sake of the country, to help with this. Concern over "respondent confidentiality" does not have to stand in the way of doing what's right for democracy.

Sincerely,

Ron

Warren,

a) I fail to see how releasing a subsample rather than a full sample protects respondent confidentiality. It strikes me rather as an expedient way to partially fulfill a public responsibility. Why not fulfill it all the way?

b) I don't appreciate being called "unethical". **This is a critical public issue. Scheuren has shown how the "respondent confidentiality" issue can be dealt with in Ohio. I see no reason why similar national "full sample" exit poll data (with individual record backup) can't be released.** In the past, when exit polls did not deviate as much this may not have been as important.

c) **The fact that this is a subsample is not common knowledge. As I've said the NEP methodology statement says that 2042 interviews were conducted in Ohio. This is the size of the ICPSR dataset for Ohio.**

I thank you for your responses. I am just trying to be open and honest about where I'm coming from.

Sincerely,

Ron

Go Fuck yourself.

Coincidence?

- As of today (7/21/2006), EM has not explained these discrepancies.
- If the ICPSR/Roper Kerry exit poll share of 78.57% is substituted for the ESI exit poll share of 70% for one of the precincts in question (Mitofsky #4), **it becomes the precinct with by far the most significant Kerry exit poll discrepancy in Ohio, with odds of less than one in 187 billion (187,306,286,930) instead of its current odds of 5,550, that the official Kerry vote share could be as low as it was (55%) given the exit poll result.**
- The other precinct with inconsistent ESI and ICPSR exit polls also becomes markedly more significant with odds of less than one in 526,406 instead of 154, if a 81% Kerry exit poll share is substituted for the EM 75% exit poll relative to an official result of 62%.
- Do analysts all over the country know that what are called the “total # of Interviews” in EM’s methodology statement are only a random sample of about half the number of interviews, with general deviations of $\pm 3\%$, and large increases of 6% and 9% in Kerry’s exit poll vote share, relative to what ESI/EM are claiming as complete exit polls, for two precincts?

The 12 Rural County Remarkable “Series of Coincidences”

The Ohio Supreme Court Vote Anomaly

- On average in Ohio John Kerry got 32% more votes than Ellen Connally, an under-funded, pro-gay rights, anti-death penalty, liberal supreme court judge candidate from Cleveland running against an incumbent, Thomas Moyer.
- But in 12 conservative rural counties in southwestern Ohio Connally got **more** votes than Kerry.
- On average, Bush got 21% more votes than Moyer, but in 9 of these 12 counties Bush got over 43% more votes than Moyer.

Another Remarkable Series of Coincidences”?

- More specifically, of only 14 out of 88 counties where Bush did abnormally well relative to Moyer (better than a 1.43 Bush/Moyer ratio), 9 of them just happen to be the same 12 counties where Kerry implausibly got fewer votes than Connally.
- In the other 3 $K/C < 1$ counties Bush didn't do too shabbily either, his lowest ratio is in Miami which at 1.36 is still well above his overall state average (relative to Moyer) of 1.21.
- Now, some might claim that these abnormally high C/K ratios and B/M ratios are a result of voters switching from Moyer to Connally (reducing the denominator of B/M and increasing the numerator of C/K), but only *one* of these 12 counties has a lower than average Moyer share of the overall vote for supreme court.

Again Suggests Vote Shift

- Moreover, the "above average" Bush vote in $B/M > 1.43$ and $K/C < 1$ counties is 68,928 which is very close (considering that these are all estimates from state averages) to the "Lost" Kerry vote of 81,599.
- If "above average" Bush vote from the other 3 $K/C < 1$ counties is added to this it comes to 75,766, even closer to the 81,599 "lost" Kerry vote.
- A county by county comparison of the "lost" Kerry vote to the "extraordinarily above average" Bush vote in these same counties (F) and the other 3 $K/C < 1$ Counties shows a very close county by county order of magnitude correlation.
- Conclusion: about 75,000 to 82,000 votes were shifted from Kerry to Bush. I don't know how you could possibly explain this remarkable series of "coincidences" any other way!

Direct Material Proof of Election Fraud in Ohio

2004 Election Records Show Massive Vote Corruption in Miami County Ohio

- Poll book and absentee Ballot Audit Records Reveal that Miami County Official Vote Totals are Massively Corrupted.
- At Least 7% of precincts have an at least 10% discrepancy between the number of voters who voted and the officially certified number of votes.
- Four of these precincts are off by more than 100 votes.
- In at least 13% of precincts, there is at least a 5 vote difference between the officially certified vote and the number of voters who are recorded (with name and address) as having voted in these precincts.

- Minimal number of disenfranchised voters in this precinct: 132

Proof that 11/04 Ballots are going to be Destroyed

Pictures from Darke County Ohio Board of Elections. The third shows that a container with election material from a date before 11/04 does not have the “destroy” label on it. Unfortunately it is not a clear picture.

GENERAL 11-02-2004
FEDERAL BALLOTS
Destroy: 09-03-06

CITIZENS WAKE UP!

- Having had two Presidential and possibly many other elections stolen, it is time to take this issue very seriously.
- All indications suggest that electronic voting equipment can be easily hacked and corrupted by a small number of “insiders” – programmers, vendors, and election officials.
- We need: real time release of detailed disaggregated election results, routine random audits of this equipment for every election, extensive checks against other voting records, and publicly funded exit polls.
- Hand counted ballots may be the only reliable solution.
- Party and media elites wake up! This is real, it has occurred and will continue to occur unless we do something about it!
